

Problem Statement No.22 – Interview Trainer Agent

The Challenge

An Interview Trainer Agent, powered by RAG (Retrieval-Augmented Generation), prepares users for job interviews by generating personalized question sets and preparation strategies based on their profile, experience level, and job role.

The system retrieves role-specific interview questions, industry expectations, behavioral scenarios, and HR guidelines from recruitment portals, professional networks, and interview knowledge databases.

Users can provide their resume details or job title, and the agent generates targeted technical and HR questions, model answers, and improvement suggestions. The system supports both technical and soft skill assessment to provide a complete interview preparation experience.

This AI-driven assistant helps users improve confidence, communication skills, and interview performance, increasing success rates in competitive hiring environments.

Technology Used

- IBM Cloud Lite Services
- IBM Granite
- IBM watsonx.ai
- IBM watsonx Orchestrate
- Retrieval-Augmented Generation (RAG)
- Natural Language Processing (NLP)
